IV SEMESTER B.E LABORATORY RECORD
[Autonomous Scheme 2022]

R.V. College of Engineering, Bangalore - 59

(Autonomous Institution affiliated to VTU, Belagavi)

Department of Computer Science & Engineering

LABORATORY CERTIFICATE

This is to certify that Mr. / Ms. _____
with USN _____ of IV semester has
satisfactorily completed the course of experiments in IOT and Embedded
Systems Lab [CS344AI] prescribed by the department during the year
2023-2024.

R. V. COLLEGE OF ENGINEERING
[Autonomous Institution Affiliated to VTU, Belagavi] Department of
Computer Science & Engineering Bengaluru-560059

VISION

To achieve leadership in the field of Computer Science & Engineering by strengthening fundamentals and facilitating interdisciplinary sustainable research to meet the ever growing needs of the society.

MISSION

- To evolve continually as a Centre of excellence in quality education in computers and allied fields.
- To develop state-of-the-art infrastructure and create environment capable for interdisciplinary research and skill enhancement.
- To collaborate with industries and institutions at national and international levels to enhance research in emerging areas.
- To develop professionals having social concern to become leaders in top-notch industries and/or become entrepreneurs with good ethics.

Program Educational Objectives

PEO1: Develop Graduates capable of applying the principles of mathematics, science, core engineering and Computer Science to solve real-world problems in interdisciplinary domains.

PEO2: To develop the ability among graduates to analyze and understand current pedagogical techniques, industry accepted computing practices and state-of-art technology.

PEO3: To develop graduates who will exhibit cultural awareness, teamwork with professional ethics, effective communication skills and appropriately apply knowledge of societal impacts of computing technology.

PEO4: To prepare graduates with a capability to successfully get employed in the right role / become entrepreneurs to achieve higher career goals or take up higher education in pursuit of lifelong learning.

Program Outcomes

PO1: Engineering knowledge: Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization for the solution of complex engineering problems

PO2: Problem analysis: Identify, formulate, research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences and engineering sciences.

PO3: Design/development of solutions: Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for public health and safety, and cultural, societal, and environmental considerations.

PO4: Conduct investigations of complex problems: Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.

PO5: Modern tool usage: Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools, including prediction and modeling to complex engineering activities, with an understanding of the limitations.

PO6: The engineer and society: Apply reasoning informed by the contextual knowledge to assess Societal, health, safety, legal, and cultural issues and the consequent responsibilities relevant to the professional engineering practice.

PO7: Environment and sustainability: Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.

PO8: Ethics: Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.

PO9: Individual and team work: Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.

PO10: Communication: Communicate effectively on complex engineering activities with the engineering community and with the society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.

PO11: Project management and finance: Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.

PO12: Life-long learning: Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

Program Specific Outcomes

PSO1: System Analysis and Design

The student will:

1. Recognize and understand the dynamic nature of developments in computer architecture, data organization and analytical methods.
2. Learn the applicability of various systems software elements for solving real-world design problems.
3. Identify the various analysis & design methodologies for facilitating development of high quality system software products with focus on performance optimization.
4. Display good team participation, communication, project management and document skills.

PSO2: Product Development

The student will:

1. Demonstrate knowledge of the ability to write programs and integrate them resulting in state-of-art hardware/software products in the domains of embedded systems, databases /data analytics, network/web systems and mobile products.
2. Participate in teams for planning and implementing solutions to cater to business – specific requirements displaying good team dynamics and professional ethics.
3. Employee state-of-art methodologies for product development and testing / validation with focus on optimization and quality related aspects

Course Outcomes

After completing the course, the student will be able to:

CO1: Apply Embedded System and IoT fundamentals and formulate sustainable societal relevant cost-effective solutions.

CO2: Demonstrate the development of software programs using Embedded C, using Microcontrollers and different sensors and peripherals to build embedded system applications.

CO3: Design smart systems using various I/O peripherals, Sensors, embedded protocols like UART,I2C,SPI using modern tools like Keil IDE software for various domains like Healthcare, automation, agriculture, smart cities and others.

CO4: Indulge in developing Novel multi-disciplinary IoT projects using prototype boards, with effective oral & written communication skills and working in teams.

CO5: Engage in Lifelong Learning by investigating and executing real world societal problems using engineering tools – Cross compilers, debuggers and simulators, emerging processor and controller-based hardware platforms, IOT cloud infrastructure & protocols.

Do's and Don'ts in the Laboratory

Do's.....

- Come prepared to the lab with the program logic.
- Use the computers and controller kit for academic purposes only.
- Following the lab exercise cycles as per the instructions given by the department.
- Keep the chairs back to their position before you leave.
- Handle the computer and the kits with care.
- Keep your lab clean.

Don'ts.....

- Coming late to the lab and leaving the lab early.
- Move around in the lab during the lab session.
- Download or install any software onto the computers.
- Tamper system files or try to access the server.
- Write record in lab.
- Change the system assigned to you without the notice of lab staff.
- Carrying CD's, Floppy's, Pen Drives and other storage devices into lab.
- Using others login id's.

PARTICULARS OF THE EXPERIMENT

Prog No.	Program	Page No	Marks Split as per rubrics						Marks (10)
			Execution			Viva			
			2	2	2	2	2	2	
1	Simulator Elevator Interface using switches and LEDs.	31							
2	Seven Segment Display Interface: Write a C program to display messages “FIRE” & “HELP” on 4-digit seven segment display alternately with a suitable delay.	34							
3	Stepper Motor Interface: Write an Embedded C program to rotate stepper motor in clockwise direction for “M” steps, anti-clock wise direction for “N” steps.	39							
4	DAC Interface: Write an Embedded C program to generate sine, full rectified, triangular, sawtooth and square waveforms using DAC module	42							
5	Matrix Keyboard Interface: Write an mbedded C program to interface 4 X 4 matrix keyboard using lookup table and display the key pressed on the Terminal.	49							
6	DC Motor Interface: Write an Embedded C program to generate PWM wave to control speed of DC motor. Control the duty cycle by analog input.	53							
7	Character LCD Interface: Write an Embedded C program to display text messages on the multiple lines of the display.	57							
Total for 70 Marks									

LAB INTERNALS	
RECORD Marks	/ 20 Marks
Mini Project	/ 20 Marks
TEST	/ 10 Marks
TOTAL	/ 50 Marks

Lab Write-up and Execution Rubrics (Max: 6 marks)					
Sl no	Criteria	Excellent	Good	Poor	Score
1	Understanding of problem and requirements (2 Marks) CO1	Student exhibits thorough understanding of program requirements and applies Embedded C for ARM concepts. (2M)	Student has sufficient understanding of program requirements and applies Embedded C for ARM concepts. (1.5M - 1M)	Student does not have clear understanding of program requirements and is unable to apply Embedded C for ARM concepts. (0M)	
2	Design & Execution (2Marks) CO 2, 3	Student demonstrates the design & execution of the program with optimized code with all the modifications and test cases handled. (2M)	Student demonstrates the design & execution of the program without optimization of the code and handles only few modifications and few test cases. (1.5M - 1M)	Student has not executed the program. (0M)	
3	Results and Documentation (2Marks) CO 1, 4	Documentation with appropriate comments and output with observations is covered in manual. (2M)	Documentation with only few comments and only few output cases is covered in manual. (1.5M - 1M)	Documentation with no comments and no output cases covered in manual. (0M)	
Viva Voce Rubrics (Max: 4 marks)					
1	Conceptual Understanding (2 Marks) CO 1	Explains related architecture & Embedded C related concepts involved. (2M)	Adequately explains architecture & Embedded C related concepts involved. (1.5-1M)	Unable to explain the concepts. (0M)	
2	Use of appropriate Design Techniques (2 Marks) CO 2, 3	Insightful explanation of appropriate design techniques for the given problem to derive solution. (2M)	Sufficiently explains the use of appropriate design techniques for the given problem to derive solution. (1.5M-0.5M)	Unable to explain the design techniques for the given problem. (0M)

Part A- ARM Fundamentals

ARM Architecture (Instruction Set Architecture – ISA)

ARM – stands for “Advanced RISC Machine” , ARM based microcontrollers are very popular in 32 bit embedded market, occupying the major share of the market. ARM7 was the first commercial success, used extensively in products like PDAs, iPods, hard disks, set-top boxex, mobile phones etc.

Operating Modes : ARM has seven operating modes, i.e it exists in any one of these modes when the processor is running,

- User mode: simplest mode with least privileges (or also referred as Unprivileged mode), this is the mode under which most applications run, User mode is used for the execution of programs and applications.
- FIQ Mode (Fast interrupt request): Entered this mode on request from FIQ interrupts
- IRQ Mode (Interrupt Request): Entered this mode on IRQ request
- Supervisor: Entered on Reset and when a software interrupt instruction (SWI) is executed, and is generally the mode in which the operating system kernel operates in.
- Abort: Used to handle memory access violations, Abort is entered after a failed memory access
- Undef: Used to handle undefined instructions, Undefined is entered if the instruction is not defined (invalid opcodes)
- System: This is highly privileged mode used by operating systems to manipulate and control the activities of the processor, System mode is a special version of user mode that allows full read write access to the CPSR

Note: System mode uses the User mode register set

Register Set: ARM has 37 registers of size 32bits each, they are

- i) PC - 1 dedicated program counter
- ii) CPSR – 1 dedicated program status register, (like flag register of 8086)
- iii) 5 dedicated saved program status registers (SPSR)
- iv) 30 general purpose registers

Overview of ARM Assembly Language Instructions.

Data/Register Transfer Instructions

Format: MOV REG, REG / IMM
MVN REG, REG / IMM

Example: MOV R1,R2 ; Move contents of R2 to R1
MOV R1,#3 ; Move the immediate 3 to R1

Shift and Rotate operations can be part of other Register Transfer / Arithmetic / Logic operations. One of the operand can be operated by shift/rotate operations using barrel shifter.

Example: MOV R1, R0 , LSL #1

; rotate R0, by operation Logical Left Shift & Put the value to R1, the second operand [R0 with LSL #1] is also called as shifter operand. Register can also be used to indicate the number of bits to be shifted, Ex- MOV R1, R0, LSL R2

Similar logical/rotate options :

LSR #n - Logical Shift Right
LSL #n - Logical Shift Left
ASR #n – Arithmetic Shift Right
ROR #n - Rotate Right
RRX #n - Rotate Right Extended (i.e with Carry)
(Rotate left 'n' bits is equivalent to rotate right by (32-n) bits)

Updating of Status Flags

Updation of status flags is possible by appending “S” to the instruction,

MOVS R0, #0

Conditional Execution : Suffixing condition codes is possible for any data processing and branch instructions, if condition code satisfies instruction works, else it is a NOP instruction. There are 15 such condition codes.

Ex: MOVEQ R0, #10 ; 10 is moved to R0, if Zero flag is set else it is a NOP

Other Commonly used Condition codes :

EQ Z=1 zero flag set
NE Z=0 zero flag clear
CS C=1 carry flag set
CC C=0 carry flag clear

MI N=1 Sign/Negative flag set (number is MINUS)
PL N=0 Sign/Negative flag is clear(number is POSITIVE)

ARITHMETIC INSTRUCTIONS

Format:

ADD REG, REG, (REG/IMM)
SUB REG, REG, (REG/IMM)
RSB REG, REG, (REG/IMM)

Ex : ADDS R2,R3,R4 ; $R2 \leftarrow R3 + R4$ and update the flags (because of suffix S)

LOGICAL INSTRUCTIONS

Format:

AND REG, REG, (REG/IMM)
EOR REG, REG, (REG/IMM)
ORR REG, REG, (REG/IMM)
BIC REG, REG, (REG/IMM)

Ex: ANDS R5, R0 , R1 ; $R5 \leftarrow R0 \text{ .AND. } R1$ (bit AND operation), S – updatde flags

Ex: ORRS R5, R0 , R1 ; $R5 \leftarrow R0 \text{ .OR. } R1$ (bit AND operation), S – updatde flags

Ex: EORS R5, R0 , R1 ; $R5 \leftarrow R0 \text{ .OR. } R1$ (bit AND operation), S – updatde flags

- BIC is used to clear selected bits of the Register

Ex: BIC R5, R0 , R1 ; $R5 \leftarrow R0 \text{ .AND. } \sim R1$ (i.e R0. AND. NOT R1)

COMPARE instructions

The CPSR register contains four flags Negative(sign flag),Zero,Carry and Overflow flags, which are affected by the execution of following instructions. Flags are also affected by using suffix S to the other data processing instructions.

Format:

CMP REG, (REG/IMM)
TST REG, (REG/IMM)
TEQ REG, (REG/IMM)

- CMP R1 , R2 ; pseudo subtraction and updates the flags
- TEQ R1 , R2 ; R1. XOR . R2 pseudo XOR operation and updates the flags
- TST R1 , R2 ; R1. AND . R2 pseudo AND operation and updates the flags

MULTIPLICATION

Format:

MUL REG , REG, (REG/IMM)
MLA REG , REG, REG, REG

Examples:

MUL R1, R2, R3 - Multiply $R1 \leftarrow R2 \times R3$

MLA R4, R3, R2, R1 - Multiply and Accumulate; $R4 \leftarrow (R3 \times R2) + R1$

BRANCH INSTRUCTIONS

- 1) **B LOOP** ; branch to the address with label LOOP
 BEQ LOOP ; branch only if Zero Flag is set
 BNE LOOP ; branch only if Zero Flag is not set (i.e clear)
 (used when executing conditional/unconditional branches)
- 2) **BL NEXT** ; branch with LINK, copy the PC(address on next instruction i.e PC+4) contents to LR, then branch
 (used when calling procedures)

Format of Procedure Calls:

Ex: **BL PROC1** ; contents of PC is Copied to LR

Load & Store Instructions

Format:

LDR REG, [REG]
LDR REG, [REG, IMM]
LDR REG, [REG, REG]
LDR REG, [REG, REG, SHIFT IMM]

STR REG, [REG]
STR REG, [REG]
STR REG, [REG, IMM]
STR REG, [REG, REG]
STR REG, [REG, REG, SHIFT IMM]

Ex:

LDR R1, [R0] ; contents of memory(32 bit number – 4 bytes) pointed by R0 is loaded into R1

STR R1, [R0] ; contents of R1(32bit number-4 bytes) is stored in memory pointed by R0.

Sample Program No 1:

AIM: Translate the following code in C to the ARM instruction set. Assume variables are 32bit integers represented in Registers.

$$\underline{A = B + C - D}$$

```
AREA RESET, CODE
ENTRY

MOV R0,#00 ; A
MOV R1,#0x25 ; B
MOV R2,#0x34 ; C
MOV R3,#0x72; D

ADD R0,R2,R1
SUB R0,R0,R3

STOP B STOP
END
```

$$\underline{A = 4* A + B}$$

```
AREA RESET, CODE
ENTRY

MOV R0,#0X25 ; A
MOV R1,#0X34; B
ADD R0,R1,R0,LSL #2

STOP B STOP
END
```

Sum of 3X + 4Y + 9Z, where X = 2, Y=3 and Z=4.

```
AREA RESET, CODE
ENTRY
MOV R1, #2 ; Let X = 2
MOV R2, #3 ; Let Y = 3
MOV R3, #4 ; Let Z = 4
ADD R1, R1, R1, LSL #1
MOV R2, R2, LSL #2
ADD R3, R3, R3, LSL #3
ADD R1, R1, R2
ADD R1, R1, R3
STOP B STOP
END
```

Sample Program No 2:**AIM:** Write an ARM ALP to find smallest and largest of N- 32 bit numbers.**Algorithm:**

- 1) Initialize first element as smallest [R1] and number of elements $n = n-1$
- 2) Loop through all the n [R4] elements. If the current element is smaller than *the smallest*, then update *smallest*.

```

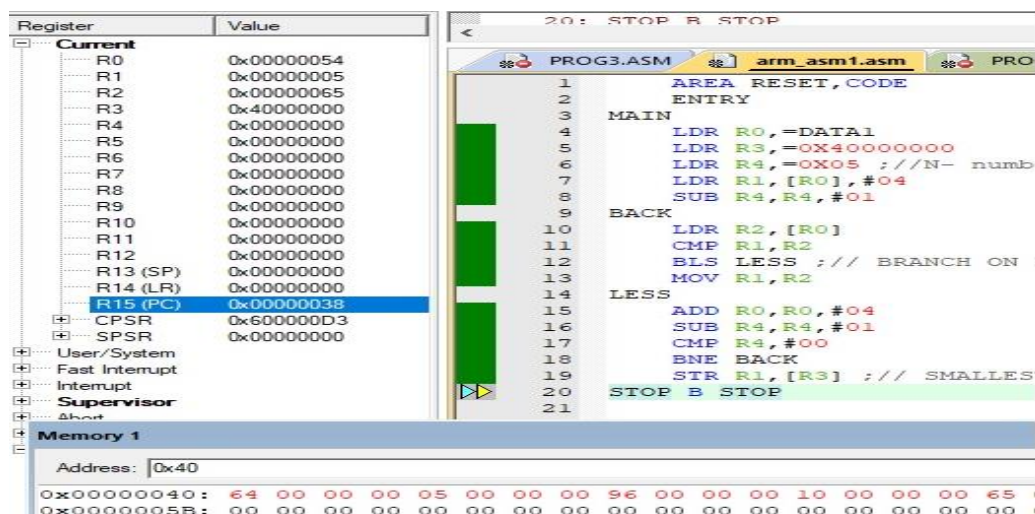

AREA RESET, CODE
ENTRY
LDR R0, =DATA1
LDR R3, =0X40000000 ; memory location for storing answer
MOV R4, #05 ; //N- number of elements
LDR R1, [R0], #04; assume first no. as smaller no & increment R0 by 4
SUB R4, R4, #01 ; compare with n-1 elements

BACK
LDR R2, [R0] ; get next number & compare with small
CMP R1, R2
B LESS ; // If R1 < R2 , BRANCH
MOVL R1, R2 ; update with new smaller no

LESS
ADD R0, R0, #04 ; increment pointer to next number
SUB R4, R4, #01
CMP R4, #00
BNE BACK
STR R1, [R3] ; // SMALLEST VALUE STORED IN MEMORY LOCATION
STOP B STOP

AREA DATA, CODE
DATA1 DCD &64, &05, &96, &10, &65
END

```

Sample Output:

Sample Program No 3:

AIM: Write an ARM ALP to count the occurrences of the given 32-bit number in a List using Linear Search algorithm

Algorithm:

Linear Search (array A, key x)

```
{
  for i =0 to n
    if A[i] = x then
      increment element found count
}
```

Program:

AREA RESET, CODE, READWRITE

ENTRY

LDR R0,=ARR

MOV R1, #0 ; Loop Iterator

MOV R7, #0 ; Number Of occurrences in The Array

MOV R4, #4 ; key

CONT

LDR R3,[R0]

CMP R3, R4

BNE SKIP

ADD R7, R7,#1

SKIP

ADD R0, #4

ADD R1, #1

CMP R1, #10 ; no of elements

BNE CONT

STOP B STOP

ARR DCD 0,5,1,4,100,4,0,8,7,20

END

Sample Output:

The screenshot displays an ARM assembler interface with three main panels:

- Registers Panel:** Shows the current state of ARM registers. R7 is highlighted with a value of 0x00000002.
- Disassembly Panel:** Shows the assembly code being executed. The current instruction is `ADD R0, #4` at address 0x0000002C. Other visible instructions include `ADD R1, #1`, `CMP R1, #10`, `BNE CONT`, `STOP B STOP`, and `END`.
- Memory Panel:** Shows the memory contents starting from address 0x00000034. The data stored in memory is: `00 00 00 00 05 00 00 00 01 00 00 00 04 00 00 00 64 00 00` (hex) and `00 04 00 00 00 00 00 00 00 08 00 00 00 07 00 00 00 14 00` (hex).

Sample Program No 4:**AIM:** Write an ARM ALP to compute GCD of two given 32-bit numbers.**Algorithm:**

```

int gcd(int x,int y){
    while(x!=y)
    {
        if(x>y)
            return gcd(x-y,y);
        else
            return gcd(x,y-x);
    }
    return x;
}

```

Program:

```

        AREA RESET, CODE
        ENTRY
        MOV R0, #30 ; test values
        MOV R1, #45 ; test values
LOOP    CMP R0, R1
        BEQ EXIT
        BGT COND1
        SUB R1, R0
        B LOOP
COND1   SUB R0, R1
        B LOOP
EXIT    LDR R0, =GCD
        STR R1, [R0]
STOP    B STOP
        AREA RESULT, DATA
GCD     SPACE 4
        END

```

Sample Output:

The screenshot displays the ARM disassembler interface. On the left, the 'Registers' window shows the current state of registers: R0 is 0x00000000 and R1 is 0x0000000F. The main window shows the disassembly of the program, with instructions ranging from 0x00000004 to 0x00000030. The instructions include MOV, CMP, BEQ, BGT, SUB, B, LDR, and STR. The 'Memory' window at the bottom shows the value 0F 00 00 00 at address 0x40000000, which corresponds to the GCD result stored in memory.

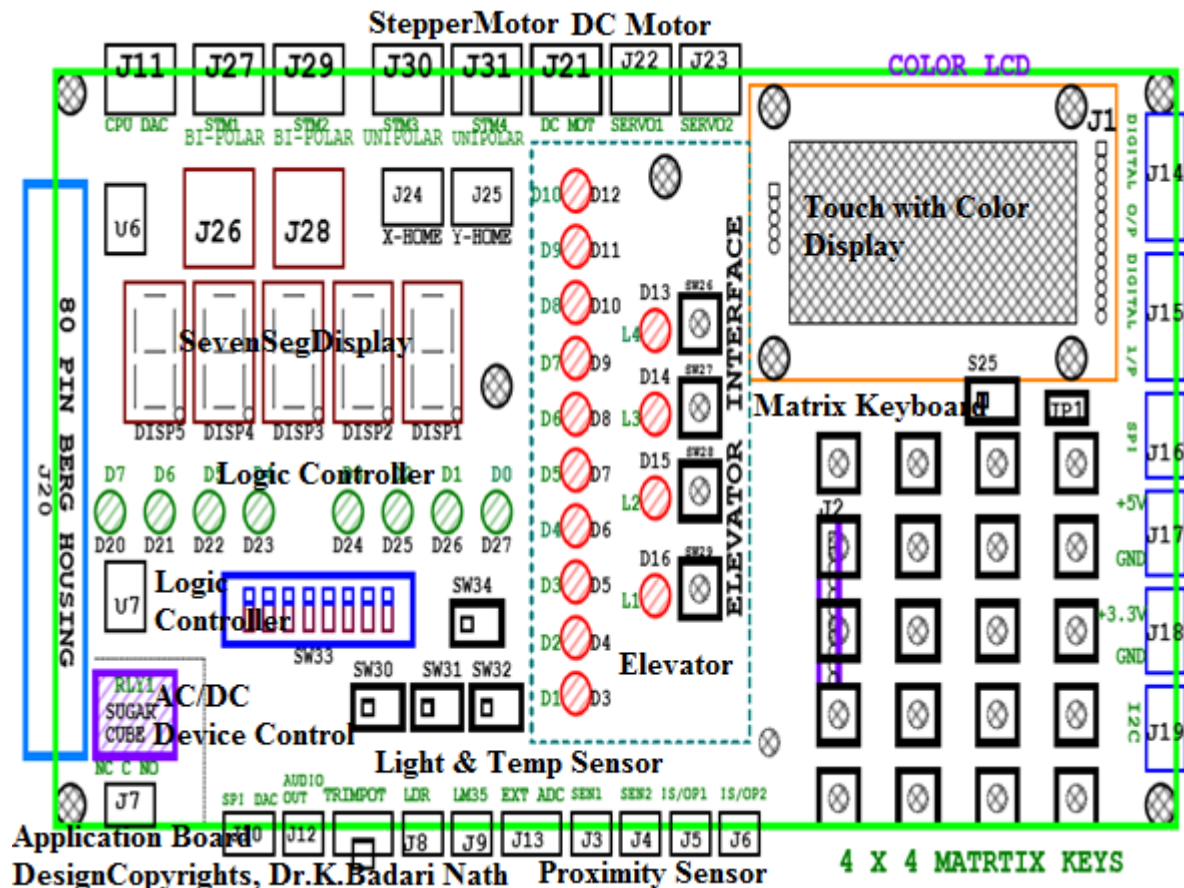

PART – A

Interfacing Programs using ARM LPC 2148

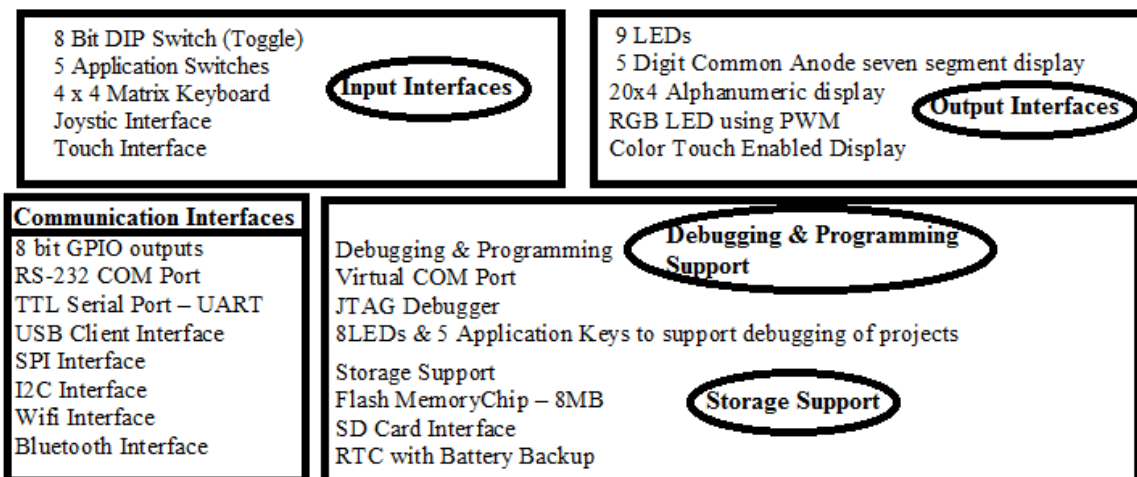

ARM CPU Board

ARM Application Board

Board Specifications: Power : 12V, 1A

Board Specifications: RV - ARM AllInOne Board
ARM CPU Board & Application Board

Sample program : Interfacing LED and Switches

Interfacing Diagram

//Sample Program 1: Interfacing LED and Switch to LPC2148 using GPIO pins

//P0.31 connected to LED - D7 in CPU board(common anode)

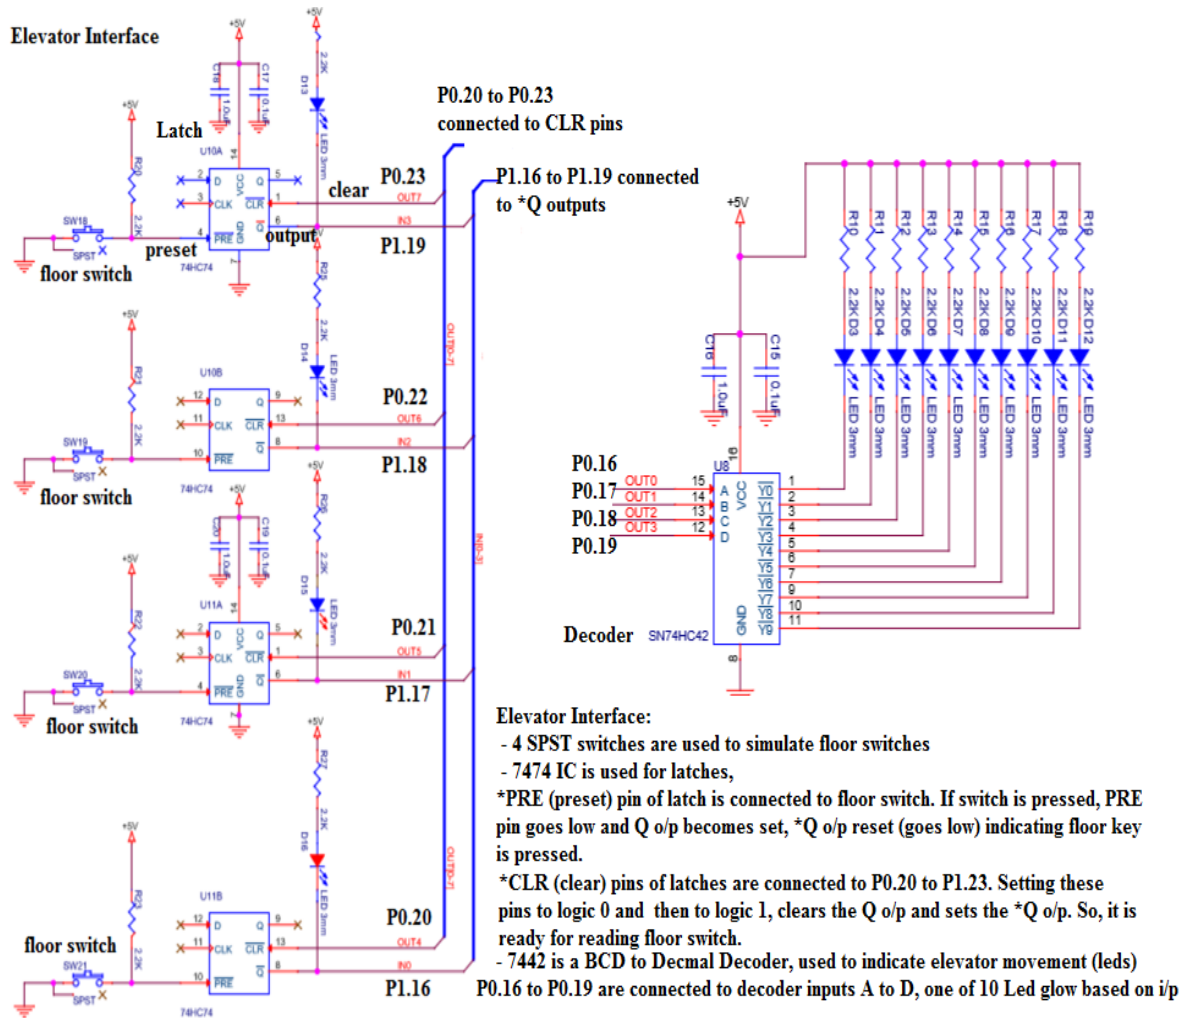

//P1.14 connected to Switch - SW2 in CPU board

```
#include <lpc214x.h>
#define LED_OFF (IO0SET = 1U << 31)
#define LED_ON (IO0CLR = 1U << 31)
#define SW2 (IO0PIN & (1 << 14))
void delay_ms(unsigned int j);
int main()
{
    IO0DIR = 1U << 31;
    IO0SET = 1U << 31;
    while(1)
    {
        if (!(IO0PIN & (1 << 14))) // (if (!SW2))
        {
            IO0CLR = 1U << 31; // LED_ON
            delay_ms(250);
            IO0SET = 1U << 31; // LED_OFF
            delay_ms(250);
        }
    }
}

void delay_ms(unsigned int j)
{
    unsigned int x, i;
    for(i=0; i<j; i++)
    {
        for(x=0; x<10000; x++); /* loop to generate 1 milisecond delay with CCLK = 60MHz */
    }
}
```

Program 1: Elevator Interface: Write an Embedded C program to read the elevator switches and simulate elevator up and down movements.

Interfacing Diagram

//Elevator Program:

// P0.16 - P0.19 are connected to decoder inputs, it makes one of the o/p LEDs 0 to 9 on

// P0.20-P0.23 are connected to *CLR pins of latches: make it '0' and then '1' to clear

// elevator keys: *Q outputs of latches connected to P1.16 TO P1.19

```

#include <lpc214x.h>

```

Interfacing Circuit working Explanation:

Output Observation:

Program 2: Seven Segment Display Interface: Write a C program to display messages “FIRE” & “HELP” on 4 digit seven segment display alternately with a suitable delay.

Serial In Parallel Out mode of Shift Register (74HC4094) is used to send 8 bits of data to seven segment display. Seven segment display used is of common anode type i.e. we have to send 0 to make corresponding segment ON and 1 to make it OFF.

To display 3, we have to send following bit pattern,

DP	G	f	E	d	c	b	a
1	0	1	1	0	0	0	0

This is B0 in hexadecimal. To send B0H we have to start sending the bits from MSB onwards i.e D7 first, D6 next and so on with D0 being the last

Clock pulses are required to clock in the data, 8 clock pulses for one byte of data. As shift registers are cascaded, $8 \times 4 = 32$ clocks are required to clock in 4 bytes of data. To send “12345”, first we have to send ‘1’, then ‘2’, ‘3’, ‘4’ and lastly ‘5’. All the shift registers are cascaded, the data is fed to the shift register using serial in parallel out method. Strobe is used to copy the shifted data to the output pins. STB is generated after shifting is completed.

Interfacing Diagram

Output Observation:

Program No.3: Stepper Motor Interface: Write an Embedded C program to rotate stepper motor in clockwise direction for “M” steps, anti-clock wise direction for “N” steps.

Interfacing circuit diagram

- Total number of steps for one revolution = 200 steps (200 teeth shaft)

$$\text{Step angle} = 360^\circ / 200 = 1.8^\circ$$

- Use appropriate delay in between consequent steps
- 2Phase, 4winding stepper motor is used, along with driver circuit(ULN 2803) built on the RV All-In- One Card, 12v power is used to drive the stepper motor. Digital input generated by the microcontroller, is used to drive and control the direction and rotation of stepper motors. If it is required to drive bigger/higher torque stepper motors only change is- use MOSFETS or higher power stepper driver ICs to drive motors

//Stepper Motor Program:

//P0.16 to P0.19 are connected to Windings of SMotor

```

```

Interfacing Circuit working Explanation:

Output Observation:

Program No.4: DAC Interface : Write an Embedded C program to generate sine, full rectified sine, Triangular, Sawtooth and Square waveforms using DAC module

- DAC module of LPC 2148 is 10 bit Digital to Analog converter used to convert 10 bit Digital data to corresponding Analog voltage.
- Digital I/P : **000 to 3FF (0 to 1023)**, corresponding Analog O/P : **0V to 3.3V**
- Resolution = $(3.3/1024)$ $\approx 3.2\text{mili volts}$

Look up Table Creation: Look up tables are used extensively in embedded systems, to store precomputed digital values, corresponding to analog voltages and used to generate different waveforms using DAC Module. Here the explanation about creating sine table is given.

Formula for calculation of the sine table entries: **$512 + 511 \times \sin \theta$**

(512 Corresponds to 1FFh, i.e. $3.3/2$ V, $511 \times \sin 90$ gives 511, so $512 + 511 = 1023$ (for 3.3V). Calculate the digital values to be outputted to DAC for angles in the steps of 6° ,

$511 \times \sin 0 = 0$	$511 \times \sin 48 = 380$
$511 \times \sin 6 = 53$	$511 \times \sin 54 = 413$
$511 \times \sin 12 = 106$	$511 \times \sin 60 = 442$
$511 \times \sin 18 = 158$	$511 \times \sin 66 = 467$
$511 \times \sin 24 = 208$	$511 \times \sin 72 = 486$
$511 \times \sin 30 = 256$	$511 \times \sin 80 = 503$
$511 \times \sin 36 = 300$	$511 \times \sin 86 = 510$
$511 \times \sin 42 = 342$	$511 \times \sin 90 = 511$

Output the above values in the reverse order to get other portion of the top half cycle, (add 512 for top half cycle, and subtract from 512 for the lower half cycle, refer the table declaration).

Interfacing Circuit working Explanation:

Output Observation:

Program No.5: Matrix Keyboard Interface : Write an embedded C program to interface 4 X 4 matrix keyboard using lookup table and display the key pressed on the Terminal.

Interfacing Diagram

Working method:

- If no key is pressed, we will have on columns 0-3, '1111' on P1.16 to P1.19, as all the inputs are pulled up by pull up resistors.
- If we press any key, let '0' key be pressed, it will short row0 and col0 lines (P0.16 & P1.19), so whatever data (0 or 1) available at row0 (P0.16) is available at col0 (P1.19). Since already columns are pulled high, it is required to apply logic '0' to see change in col0 when the key is pressed.
- To identify which key is pressed,
 - Check for a key press in first row by out putting – '0111' on row's, check which column data is changed, if no key press go for next row
 - Check for a key press in second row by out putting – '1011' on row's, check which column data is changed, if no key press go for next row
 - Check for a key press in third row by out putting – '1101' on row's, check which column data is changed, if no key press go for next row
 - Check for a key press in last row by out putting – '1110' on row's, if no key is pressed go for the first row again
- Once the key press is found, use the row number and column number and look up table to convert the key position corresponding to ascii code. Use appropriate delay for debouncing.

```

//Matrix 4 x 4 Keyboard
//Columns & Rows are pulled to +5v,if dont press key, we receive '1' on columns
//Method: Sending '0' to a selected row, checking for '0' on each column
//ROWS - ROW0-ROW3 -> P0.16,P0.17,P0.18,P0.19

Interfacing Circuit working Explanation:

Output Observation:

Program No.7: Alpha Numeric LCD Interface - Write an Embedded C program to display text messages on the multiple lines of the display.

LCD's are preferred to seven segment displays because of their versatility and capability to house more information. 2 line (2 x 6) and 4 line (4x20) is the most popular, low cost character oriented LCD, suitable for understanding the working and programming of LCD. You have seen LCD modules used in many of the electronics devices like coin phone, billing machine and weighing machines. It is a powerful display options for stand-alone systems. Because of low power dissipation, high readability, flexibility for programmers, LCD modules are becoming popular.

LCD consists of DDRAM, CGROM, Shift registers, bit/pixel drivers, refreshing logics and lcd controller. The data to be displayed on lcd, is to be written on to the DDRAM-display data Ram using the ascii format. CGROM-Character generator rom, contains dot/pixel patterns for every character to be displayed (pre programmed). Shift registers are used to convert CGROM parallel data to serial data(serializing), drivers are required to drive (ON/OFF) the bits, refreshing logics are required to hold the display data, as the dots are displayed row by row basis continuously, like in CRT.

LCD provides many control pins, to enable the microcontroller or microprocessor to

communicate, whatever the data we write to LCD is of two types, either it is a command to the LCD(to configure) or ASCII code of character to be displayed on LCD (to DDRAM). RS signal is used for this,

RS (Register Select): 0 or 1

- 0 - writing command byte into command register of LCD
- 1 - writing data (ASCII code) into Data register of LCD

R/W : (Read/Write) (In our kit, R/W is grounded)

- 0- Write to LCD (Data/Command)
- 1- Read from the LCD

E (Enable) : 1 to 0 pulse

- Enable is required to perform the writing/reading to LCD, E – '1' (for 450nsec) & then '0' (High to Low Pulse)

D0-D7 - It is a bidirectional data bus, used to write data/command to LCD or reading status. In 4bit nibble mode, only lines D4 – D7 are used for communication.

Interfacing Diagram

LCD Command Table

Instruction	D7	D6	D5	D4	D3	D2	D1	D0	Description
Clear display	0	0	0	0	0	0	0	1	Clears Display and returns cursor to home position.
Cursor home	0	0	0	0	0	0	1	X	Returns cursor to home position. Also returns display being shifted to the original position.
Entry mode set	0	0	0	0	0	1	I/D	S	I/D = 0 - cursor is in decrement position. I/D = 1 - cursor is in increment position. S = 0 - Shift is invisible. S = 1 - Shift is visible
Display ON- OFF Control	0	0	0	0	1	D	C	B	D- Display, C- Cursor, B-Blinking cursor 0 - OFF 1 - ON
Cursor/ Display Shift	0	0	0	1	S/C	R/L	X	X	S/C = 0 - Move cursor. S/C = 1 - Shift display. R/L = 0 - Shift left. R/L = 1 - Shift right.
Function Set	0	0	1	DL	N	F	X	X	DL = 0 - 4 bit interface. DL = 1 - 8 bit interface. N = 0 - 1/8 or 1/11 Duty (1 line). N = 1 - 1/16 Duty (2 lines). F = 0 - 5x7 dots. F = 1 - 5x10 dots.

Programming 4 x 20 alphanumeric LCD

Two steps are involved,

1. Configure the LCD for different parameters/settings, by writing series of commands (command bytes) like
 - Function set command(0x28)
 - Display On command(0x0C)
 - Clear display (0x01)
2. Writing actual string data to LCD, character by character, (by default characters are displayed from line1 first column position, we can issue DDRAM address command - 0x80 + char pos, for first line, 0xc0 + char pos, for second line, 0x94+char pos, for third line, 0xD4+char pos, for fourth line).

```
//Alpha-numeric LCD Interface (4Lines,20characters)
//Connected in 4bit nibble mode
//LCD handshaking:RS->P0.20,EN->P0.25 ,R/W -Gnd
//LCD data:D4,D5,D6,D7 -> P0.16,P0.17,P0.18,P0.19
```

```
#include <lpc214x.h>
